Advanced Features

Self-Tuning PID (Standard)

Blind Function (Standard)

The mode screen or the parameter screen whichever you demand can be displayed by merely pressing a key, at the request. When the SV screen is erased, the set value is normally not indicated but the measured value (PV) is only shown.

Timer Function (Standard)

1. Bread Oven Machine

- Put dough into oven and press the timer start key.
- While setting timer, temperature in oven is controlled by heater.
- After timer counts up, control of oven is stopped automatically. (This example is for control stop after the timer counts up.)

2. Package Machine and Industry Machinery

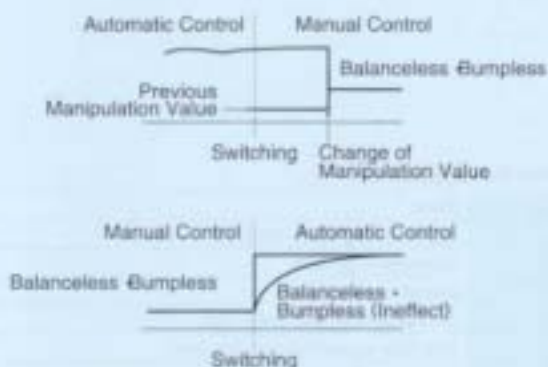

(In case of start of control after the relative equipments are prepared)

- When power is "ON", the timer starts to count.
- While setting timer, control output is stopped.
- After the timer counts up, control is started automatically. (For control start after the timer counts up.)

Automatic/Manual Control (Standard)

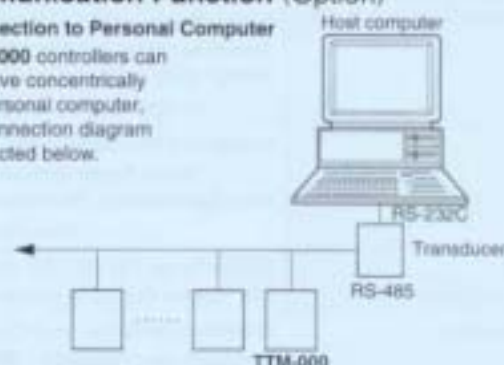

Automatic/Manual control can be switched by front key for DI or communication. When checking the manipulation action for valve and heater during a system test run, or when normal control is not operational due to sensor failure, the system can be operated manually in this mode.

Communication Function (Option)

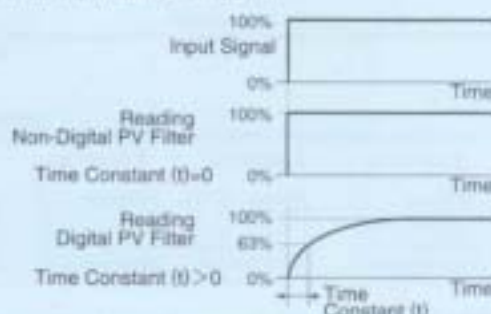

Connection to Personal Computer

TTM-000 controllers can observe concentrically by personal computer, as connection diagram instructed below.

Digital PV Filter (Standard)

This is a function to realize a CR filter effect on software by means of primary delay arithmetic on the measured value (PV). The filter effect can be set by time constant (t). (The time constant is a period to reach 63% of PV value, when the input changes stepwise.)

Digital PV filter with the following uses

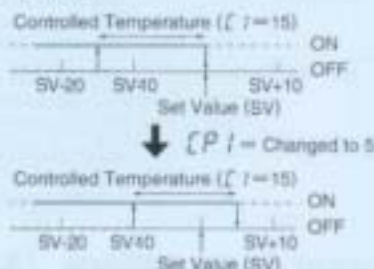

- To eliminate high frequency noise: When electric noise is added to the input, the adverse effect is reduced.
- When input changes abruptly, the response delay is possibly made.

Over-Shoot Protection PID (Standard)

Sifting OFF Position in ON-OFF Control (Standard)

When the shift value is set to 0(zero), the OFF position is the set value position.

When the OFF position setting is shifted by +5, ON /OFF position shifts to that of +5 minutes upper than the original position, though the set value is not changed. When the OFF position setting is shifted toward the minus direction, the OFF position shifts in the reverse direction.

Heating/Cooling PID Control (Option)
